#### **Range extension of Puna Ibis**

#### ***Plegadis ridgwayi* and new observations of Tamarugo Conebill *Conirostrum tamarugense* in northern Chile**

During a visit to the high Andes of Atacama (Región II) in northern Chile, on 17 October 2009, en route to El Tatio we paused at Vado de Putana ( $22^{\circ}31'S$   $68^{\circ}02'W$ ; 4,286 m) where we observed two Puna Ibis *Plegadis ridgwayi*. To date, in Chile the species has only been found in Región I, with the southernmost population at Huasco Salar<sup>1,4</sup>. It mainly inhabits the altiplano region with a few birds descending to the coast at Arica<sup>3</sup>. Our observation extends the species' range in the altiplano by c.350 km south.

On 18 October 2009, we observed two pairs of Tamarugo Conebill *Conirostrum tamarugense* in the *Prosopis tamarugo* forest by the main road between San Pedro de Atacama and Toconao ( $22^{\circ}56'S$   $68^{\circ}10'W$ ; 2,399 m). They were observed 10 km south of San Pedro, constantly vocalising. The species is locally common during the breeding season in the *P. tamarugo* forest inland of Iquique, and it can also be found in oasis valleys near Arica. In the non-breeding season, the species moves to higher altitudes in the pre-puna shrub zone<sup>2</sup>. There is a previous record from the environs of Toconao, an observation in 1988<sup>5</sup>, but the species might be fairly common and could breed there.
